

ROLE

You are a senior Next.js architect, UI/UX designer, frontend engineer, and developer experience specialist.

Your task is to transform my existing portfolio website into a production-grade Next.js 15 application that serves as the foundation for a future platform consisting of:

- Portfolio
- Technical blog
- Build logs
- Notes system
- Resource library
- Productized service catalog
- PayHero payment integration
- Newsletter
- Future API endpoints

The output should represent the completion of Day 1 of the project roadmap.

You must generate a complete, functional Next.js project structure and implementation plan.

EXISTING SITE REFERENCE

The current site is a static HTML/CSS/JS portfolio hosted at:

`sudo-hades.dev`

The visual identity should be preserved while improving the execution.

Core characteristics:

- Dark theme
- Cyberpunk-inspired
- Neon glow accents
- Terminal/developer aesthetic
- Modern typography
- Animated interactions
- High contrast
- Minimalist presentation

DO NOT create a generic SaaS landing page.

DO NOT create a generic Tailwind template.

Retain the unique identity while making it more mature and professional.

DESIGN EVOLUTION GOALS

The current design is visually strong but slightly aggressive.

The redesign should feel:

- More premium
- More intentional
- More minimal
- More professional
- More readable
- Less visually noisy

Imagine a blend of:

- Linear
- Vercel
- Raycast
- Warp Terminal
- GitHub Dark
- Modern developer portfolios

while retaining the sudo-hades branding.

VISUAL DIRECTION

Background

Replace the existing background with a dark mesh gradient system.

Requirements:

- Deep charcoal
- Near-black
- Dark grey gradients
- Subtle mesh gradients
- Soft vignette
- Slight animated movement

Example palette:

Background:

080808

0f0f0f

111111

161616

Mesh gradients: `rgba(0,255,255,0.06)` `rgba(0,140,255,0.05)` `rgba(180,0,255,0.04)`

The mesh gradients should move extremely slowly.

Almost imperceptibly.

The site should feel alive but calm.

Neon Effects

The current neon glow is too intense.

Create softer glows.

Glow should feel:

- expensive
- premium
- subtle
- controlled

Avoid:

- large bloom
- excessive blur
- bright cyan everywhere

Instead:

- thin glow edges
- soft shadows
- selective highlights

Use glow only for:

- active nav item
 - buttons
 - hover states
 - selected cards
 - terminal accents
-

Typography

Use:

Primary: Inter

Monospace: JetBrains Mono

Hierarchy:

Large hero typography: font-weight 700

Body: font-weight 400-500

Mono text: JetBrains Mono

Spacing should feel generous.

ANIMATION SYSTEM

Use Framer Motion.

Animations must be elegant.

Avoid:

- flashy effects
- excessive movement
- large transforms

Preferred:

Fade + slight translate

Example:

Initial:

opacity: 0 y: 12

Animate:

opacity: 1 y: 0

Duration:

0.5–0.8s

Hover Interactions

Cards:

- slight elevation
- subtle glow
- subtle border shift

Buttons:

- smooth glow increase
- micro scale

Maximum:

scale(1.02)

Page Transitions

Implement route transitions.

Subtle fade.

No dramatic transitions.

TECH STACK

Framework:

Next.js 15 App Router

Language:

TypeScript

Styling:

Tailwind CSS

Animation:

Framer Motion

Icons:

Lucide React

Content:

MDX-ready architecture

Theme:

next-themes

SEO:

Metadata API

ARCHITECTURE

Create a scalable structure.

app/

(page routes)

components/

ui/ layout/ sections/ animations/

content/

blog/ notes/ build-log/ resources/

lib/

seo/ content/ utils/

public/

images/ projects/ profile/ icons/

styles/

MODULARITY REQUIREMENTS

Every major asset must be easily replaceable.

Profile image:

public/profile/profile.jpg

Project thumbnails:

public/projects/

Icons:

public/icons/

No hardcoded image imports.

Use centralized configuration.

Create:

lib/site-config.ts

Example:

```
export const siteConfig = { name: "Jesse Jacob", brand: "sudo-hades", tagline: "...", socials: {}, contact: {} }
```

The entire site should update from this file.

DAY 1 DELIVERABLES

Generate the complete implementation for:

1. Global layout
 2. Navigation
 3. Footer
 4. Theme system
 5. Homepage
 6. SEO foundation
 7. Component architecture
 8. Content architecture
 9. Responsive design
 10. Animation system
-

HOMEPAGE STRUCTURE

Hero

Large introduction.

Not resume-focused.

Positioning-focused.

Example structure:

Headline:

Linux Systems Engineer, Automation Developer, and Full-Stack Builder

Subheadline:

Building infrastructure, automation systems, and practical software solutions.

CTA buttons:

View Projects

Work With Me

Featured Expertise

Grid:

Linux Administration

Automation

DevOps

Web Development

Infrastructure

Technical Consulting

Featured Projects

Showcase 3 projects.

Card layout.

Future MDX driven.

Current Build

Dynamic section.

Placeholder data.

Future integration.

Example:

Currently Building

VPS Hosting Platform

Status: Active

Recent Notes

Placeholder content.

Future MDX integration.

Footer

Professional.

Minimal.

Social links.

Copyright.

SEO FOUNDATION

Implement:

Metadata API

OpenGraph

Twitter Cards

robots.ts

sitemap.ts

Canonical URLs

Structured data support

ACCESSIBILITY

Must achieve high accessibility standards.

Requirements:

Semantic HTML

Keyboard navigation

ARIA labels

Proper focus states

Color contrast compliance

RESPONSIVENESS

Desktop first.

Then fully responsive.

Breakpoints:

Mobile Tablet Desktop Ultra-wide

Layout should remain elegant at all sizes.

CODE QUALITY

Requirements:

- TypeScript strict mode
 - Reusable components
 - No duplicated logic
 - Clear naming
 - Scalable architecture
 - Production-ready patterns
-

OUTPUT EXPECTATION

Generate:

1. Complete folder structure.
2. All required files.
3. Component breakdown.

4. Tailwind configuration.
5. Theme configuration.
6. Global styles.
7. Example implementation.
8. Architecture decisions.

The result should feel like a premium developer brand platform that can later evolve into:

- Blog
- Notes
- Build logs
- Service marketplace
- Resource hub
- PayHero-powered storefront

without requiring a redesign.
